## Introduction

## Introduction Tertiock

Economics is a choice between alternatives all the time. Those are the trade-offs.

- Paul Samuelson
- Food spoils, barrels leak, yet all trades take time.
- Time is both the friend and the foe: depreciation \& appreciation

■ Inter-temporal assets allow agents to carry value over time.

- What are inter-temporal assets?

| Examples | Money | Capital | Bond / Debt | Social Security | Housing |
| ---: | :--- | :--- | :--- | :--- | :--- |
| Value $\uparrow / \downarrow$ | $\downarrow$ | $\downarrow$ | $\downarrow$ | $\uparrow$ | $\uparrow(?)$ |
| Cause (?) | inflates | tech | default | age | develop |

Table: Examples of Intertemporal Assets

## Income, Borrowing and Saving

## Money, Income and Wealth

■ Money: medium of exchange, allow transfer of purchasing power

- Whether a currency is trust-worthy is important
- (Flow) Income: amount of money receive for a period of time
- wage bill, market earning, investment, gov transfer

■ (Stock) Wealth: inter-temporal assets carry values

- buildings, land, machinery, capital goods - debts + credit

## Other Key Concepts

- Depreciation / Appreciation: value of stock $\downarrow / \uparrow$ over time

■ Net income $=$ gross income - depreciation
■ Savings: income not consumed

- Investment: Expenditure on newly produced capital goods

## Inter-temporal Substitution

- As time is here, current you and future you are sharing for resources

■ The opportunity cost of more current goods is less future goods

- Borrowing and lending allows resource-sharing across time

■ The "price" for inter-temporal substitution depends on the assets;

- In the case of borrowing / lending, we call the "price" as interest rate
- The position matters: the impact of change in interest rate depends on whether you are borrower or lender

## Borrowing

- Julia has 100 endowment in the future: Nothing for today.
- Julia wants to borrow some consumption today and promise to repay tomorrow with her endowment
- How much goods could Julia get for today if she commit all her endowment tomorrow?

## Borrowing

- Interest rate ( $r$ ): price to bring purchasing power forward in time
- current $\underset{1+r}{\Longrightarrow}$ future
today tomorrow
■ $\begin{array}{cc}1 & 1+r \\ \frac{1}{1+r} & 1\end{array}$

## Borrowing

■ ( $1+r$ ): supply-side tradeoff $\Rightarrow$ MRT

- Motivation for borrowing \& lending:
(1) consumption smoothing (Julia's case)
(2) Impatience

## Consumption Smoothing

- The indifference curve exhibits diminishing marginal returns to consumption in one period.
- Avoid consuming a lot in one period and little in the other.
- Discount rate ( $\rho$ ): measure of one's impatience/precautions

## Pure Impatience

How much more do you value a good now than later?

- Consumption smoothing may appear as being impatient.

■ However, we differentiate it from pure impatience $=$ being impatient as a person.

- Myopia (short-sightedness): People experience the present satisfaction more strongly than the same satisfaction later
- Prudence: People know that they may not be around in the future, and so they want to consume now

## Optimal Decision-Making for Borrowers

- In equilibrium
$M R S=M R T$, i.e.,
$1+\rho=1+r$
- At $10 \%$ interest rate, Julia is happy at point $E$ (intersection of IC and FF)

## Optimal Decision-Making for Borrowers

■ $r: 10 \% \rightarrow 78 \%$, optimal decision: $E \rightarrow G$.

- Julia hurts since she is borrowers:
- Point $F$ is when Julia only wants 35 consumption now under $10 \%$ of interest rate.
- Income and substitution effects also applies.
 How?

## Saving

- Marco is a saver with 100 endowment today
- Macro store his grain: $20 \%$ of loss
- Macro lend to Julia: achieve medium utility w/o grain loss

## Saving

- Reservation indifference curve: outside option for Marco
- What is reservation IC for Julia?

## Reservation Indifference Curve

- Reservation indifference curve: all of the points at which the individual would be just as well off as at the reservation position (endowment).
- Room for trade is to ensure Marco is happier than reservation IC; o/w
 Marco is not lending!

## Banks and Money

## The Financial System

## Balance Sheet

- Assets: Anything of value that is owned.
- Liabilities: Anything of value that is owed.
- Net worth: assets - liabilities

## Balance Sheet and Wealth

Now - before consuming

| Julia's assets |  | Julia's liabilities |  |
| :--- | :--- | :--- | :--- |
| Cash | $\$ 58$ | Loan | $\$ 58$ |

Net worth $=\$ 58-\$ 58=0$

Now - after consuming

| Julia's assets |  | Julia's liabilities |
| :--- | :--- | :--- |
| Cash | OLoan | $\$ 58$ |

Net worth = - \$58

Later - before consuming

| Julia's assets |  | Julia's liabilities |  |
| :--- | :--- | :--- | :--- |
| Cash | $\$ 100$ | Loan | $\$ 64$ |

Net worth = \$100-\$64=\$36

Later - after consuming

| Julia's assets |  | Julia's liabilities |  |
| :--- | :--- | :--- | :--- |
| Cash | $\$ 64$ | Loan | $\$ 64$ |

Net worth = 0

## Banks

- Banks: firm that makes profits by lending and borrowing
- Borrow from households (deposits), other banks, and the central bank at a lower interest rate
- Lend out loans at a higher interest rate
- Cost:
- operational: the salaries of bank officers, branch rents
- interest costs: paying interest on their deposits and other borrowing
- Revenue: interest and repayment of loans
- Expected return: The return on the loans, taking into account the default risk.

## Bank's Balance Sheet

| Assets (owned by the bank or owed to it) |  | \% of <br> balance <br> sheet | Liabilities (what the bank owes households, firms and other banks) |  | $\%$ of balance sheet |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1. Cash and reserve balances at the central bank | Owned by the bank: immediately accessible funds | 2 | 1. Deposits | Owned by households and firms | 50 |
| 2. Financial assets, some of which (government bonds) may be used as collateral for borrowing | Owned by the bank | 30 | 2. Secured borrowing (collateral provided) | Includes borrowing from other banks via the money market | 30 |
| 3. Loans to other banks | Via the money market | 11 | 3. Unsecured borrowing (no collateral provided) |  | 16 |
| 4. Loans to households and firms (e.g. mortgages) |  | 55 |  |  |  |
| 5. Fixed assets such as buildings and equipment | Owned by the bank | 2 |  |  |  |
| Total assets |  | 100 | Total liabilities |  | 96 |
|  |  |  | 4. Net worth = Total assets - total liabilities = equity |  | 4 |

## Bank's Net Worth

Net worth $=$ assets - liabilities

- means what is owed to the shareholders/ owners
- also called equity
- net worth $<0$ means bank is insolvent
- i.e., unable to repay debt
- Leverage describes the reliance of a company on debt:

$$
\text { leverage }=\frac{\text { total assets }}{\text { net worth }}
$$

## Central Banks

- Legal tender has to be accepted as payment by law

■ Base money/high-powered money: notes and coins. Money as legal tender

- The central bank is the only bank that can create legal tender.
- the central bank is usually owned by the government.
- Or not! e.g. Federal Reserve
- acts as the banker for the commercial banks, who have accounts at the central bank that hold legal tender.
- by crediting these accounts, the central bank can create money.

## Bank Money

Commercial banks create money by making loans

- this is called bank money $\neq$ legal tender
- it is a liability to the bank, not an asset
- banks earn profits by charging interest on bank money

| Bonus Bank's assets | Bonus Bank's liabilities |
| :--- | :--- |
| $\$ 20$ base money | $\$ 120$ payable on |
| $\$ 100$ bank loan | demand to Gino |
| Total: $\$ 120$ |  |

Table: Bonus Bank gives Gino a loan of $\$ 100$

$$
\text { Broad money }=\text { base money }+ \text { bank money }
$$

## The Money Market

- Banks need enough base money to cover their net transactions.
- They borrow base money on the money market at the short-term interest rate.
- The demand for base money depends on how many transactions commercial banks have to make.
- The supply of base money is a decision by the central bank.

## Application: central bank's policy rate impact

- The central
bank's policy rate affects the level of spending in the economy, because households and firms borrow to spend.

Right: Credit market, Left: Loan Demand for Julia spending today

## Credit Rationing

## Recall: Principal-agent Problem

- Def: conflict of interest between principal (lender) and agent (borrower)
- Lender has no info on borrower's effort in financial project $\Rightarrow$ loan may not repay
- Resolution: equity constraint and/or collateral constraint
- Equity: require the borrower to put some of her wealth into the project
- Collateral: set aside property that will be transferred loan not repaid
- Lender's risk $\downarrow \downarrow$, but at what cost?

## Credit Rationing

- Those with less wealth find it more difficult to provide equity or collateral
- Credit-constrained: borrow on unfavourable terms compared with those with more wealth
- Credit-excluded: refused loan entirely

## Credit Rationing \& Inequality

- Inequality may increase when some people are in a position to profit by lending money to others.
- Credit-rationing increases inequality: people with limited wealth are not able to profit from the investment opportunities that are open to those with more assets.
